FOR IMMEDIATE RELEASE

Monitronics International and BlueWave Security Announce Partnership to Provide IP-based Physical Security Solution

Dallas – September 22, 2006 – Monitronics International, a leading national provider of security alarm monitoring services, and BlueWave Security, The Wi-Fi Lock and Security Company, today announce a partnership to provide the next generation of centrally monitored, IP-based access control.

BlueWave's physical access control solution is an end-to-end, IP-network solution with full support for both the IEEE 802.3 (Ethernet) and 802.11 (Wi-Fi) standards. BlueWave's BlueLink door controllers eliminate the need for traditional panels, and integrate with any industry-standard locking device and electronic reader.

“Monitronics is pleased to be working with BlueWave to provide our dealers and end users a new generation of physical access control. The BlueWave technology is unique in the industry for its flexibility, ease of installation, network-centric approach to access control, and price point” said Michael Haislip, CEO.

“The BlueWave solution is the convergence of open-standard IT data networks and physical access control,” said Mance Harmon, CEO and Founder of BlueWave Security. “Each door is treated as a node on the Ethernet or Wi-Fi data network, and can be centrally managed from any location in the world. Because we eliminate the need for panels and the need to pull cables, the BlueWave solution provides fully-managed access control for about the same price and ease of installation of a stand-alone, battery-powered lock. We are delighted to be partnered with a leading provider of monitoring services.”

About Monitronics International
